

MEDIAL NASAL CLUSTERS IN INDONESIAN

Cecilio Lopez

Akl. - Aklan, Apa. - Apayaо, Bkl. - Bikol, Btk. - Bontok, Cha. - Chamo-ro, Cuy. - Cuyunon, Fij. - Fiji, Fut. - Futuna, Hil. - Hilligaynon, Hov. - Hova, Ibg. - Ibanag, Ilk. - Iloko, Ilt. - Ilongot, Ivt. - Ivatan, Jav. - Javanese, Mak. - Makassar, Mal. - Malay, Mar. - Maranao, Mgd. - Magindanao, Mlg. - Malagasy, Mnj. - Maanjan, Nbl. - Nabaloи, NgD. - Ngadju-Dayak, PNeg. - Pinatubo-Negrito, Pmp. - Pampangan, Png. - Pangasinan, Saa. - Sa'a, Sam. - Samoa, SamLey. - Samar-Leyte, Seb. - Sebu, Sbl. - Sambales, Sund. - Sundanese, Tag. - Tagalog, Tao. - Taosug, Tnt. - Tontemboan, ToB. - Toba-Batak, Ton. - Tonga.

The spelling of the starred forms in the Appendix, which come from Dempwolff's III AW [Austronesischen Woerterverzeichnis], uses Dyen's symbols. Also, certain liberties were taken in the spelling of the reflexes in the daughter languages for the purpose of this paper. For instance, Dempwolff's symbols for the spiritus asper and spiritus lenis, the breve, the line under certain V's, and the inverse breve under z in Fij. are dropped, and ng replaces the velar nasal symbol. His vertical line is replaced by the hyphen, which in the daughter languages also separates affixes from stems, compounds and reduplicated stems.

In the Philippine languages -C¹C¹- in Ibg., Ilk., and Tao represents geminate C¹, and -V¹V¹- in Tao. a long V¹. ts is unvoiced affricate in Btk.,

Ivt., Nbl., and Tao.; l in Akl. is dorsopalatal lateral; x in Nbl. is unvoiced velar fricative, and C followed by j in Tao. is palatal C. Accent to indicate stress is dispensed with except when necessary to differentiate meanings of homophones.

Introduction

The existence of medial nasal clusters¹ in PAN [Proto-Austronesian] (PIN [Proto-Indonesian] as the proto-language of the entire Austronesian family according to Dempwolff.) is admitted by many linguists. A few, however, do not share this view. The purpose of this paper is to assemble - from literature available to me - the views of those who admit such existence and those who do not, if only to arouse the curiosity of those who may be interested to pursue the subject further. As far as I can ascertain, there is to date no comprehensive study on nasal clusters in IN [Indonesian].

A paper of this nature will have to lean heavily on Dempwolff's three-volume VLAW [Vergleichende Lautlehre des austronesischen Wortschatzes],

An Appendix of 156 PAN forms from Dempwolff's III AW with reflexes in the daughter languages is added for the benefit of others. The Philippine putative cognates are not verified. This study is limited to IN.

On Dempwolff's Reconstructions

Based on the comparison of three IN languages, Tag., ToB. and Jav., Dempwolff² grouped the PAN morphs in the following possible forms: (1) CVCVC (2) CVGCCVC, (3) some polysyllabic forms which may or may not be traced back to disyllabic stems, and (4) several monosyllabic forms. CVCCVC forms are of two types: $C^1V^1C^2C^1V^1C^2$, which is interpreted as being the result of iteration of the root;³ and CVNCVC, where N is a nasal homorganic to the following C⁴, and all reflexes testify to the nasal. Where some reflexes testify to the nasal and others do not, the subtype CV(N)CVC is posited, with (N) representing a "facultative," i.e. optional, nasal accretion.⁵ Brandstetter⁶ labelled the two types, "Taptap-Typus" and "Lintah-Typus," and ascribed both to PIN.

Dempwolff⁷ postulated twelve nasal clusters for PAN: mb, mp, nd, nt, nD, nT, nz, ñs, ñj, ñc, Ng, and Nk. These combinations represent medial nasal accretion which is parallel to initial nasal accretion. The initial nasal substitution which can be ascribed to the proto-language has no parallel in medial position. Both phenomena of homorganic nasal combination and nasal substitution do not occur in final position. Dyen's⁸ proposal of an additional proto-phoneme Z which should be reconstructed with an optional prenasalized counterpart nZ is not included here because of its limited relevance to the point

at issue.

The reflexes of PAN nasal clusters vary in IN languages. They may be found in all cognate forms in some cases; in others, they may occur in some cognates but are lacking in others, i.e., only the non-nasal C occurs; and in still other cases, doublets occur in some languages, i.e., one member of the doublet has a nasal cluster and the other has only the non-nasal C. The different reflexes may be homosemantic or not.⁹

Views on Dempwolff's Reconstructions

Whether or not the nasal clusters were already existent in the proto-language, linguists are not in full accord. Costenoble¹⁰ could attest cases of undubitable nasal combinations only sparingly in Cha, which constrained him to move around in more or less hypothetical grounds. Kern¹¹ was of the opinion that the wide distribution of the nasalized and prenasalized forms shows that they must have already occurred in the "grondtaal." Without attempting to cast doubt on Dempwolff's conclusion, Grace¹² tentatively treated the reflexes of the oral grade, i.e. the non-nasal C, and the nasal grade, i.e., the nasal cluster, as equivalent. To Capell¹³ the uncertainty concerning the free variation of the (initial and medial) nasal clusters in PAN is surely "one of the most difficult points about Dempwolff's system," and to assume "that simple and prenasalized forms already existed in the parent language . . . seems unlikely."¹⁴ Kaehler¹⁵ did not share this view invoking Capell's argument of the "lack of an AN morphology." Chrétien¹⁶ believed that even if "Dempwolff used

only one language, he made a considerable progress with the vexing problem of nasal or nasalized alternants.¹⁵ However, in another paper,¹⁶ Chrétien treated CVNCVC and CV(N)CVC as if they were CVCVC, i.e. for the purpose of his paper, he ignored the nasal on the assumption only that the nasals are of secondary origin. Milner¹⁷ has tried to show that in Oceanic languages the behavior of C's which are reflexes of PAN retroflex C's forces one to posit an optional feature of prenasalization (in initial as well as) in medial position.

On the Possible Origin(s) of Nasal Clusters

According to Dempwolff¹⁸ nasal accretion in medial position was originally a morphological process (*Lautvorgang*), as it was also in initial position; the former, however, has become non-productive while the latter has remained productive. It can be assumed that the medial nasal cluster was due to infixation whose original phonetic structure and grammatical function are, however, still not explainable.

In spite of his admission of the sparsity of nasal combinations in Chamorro, Costenoble advanced three rather elaborate theories on the origins of nasal clusters: (1) When the first syllable ending in a nasal is followed by a second syllable beginning with a non-nasal C, the structure could have been CVNCVC when the stem consists of two monosyllabic roots, or CVNCVN when a root ending in a nasal is reduplicated; (2) When one of the infixes -an-, -in- or -um- is inserted after the first V of CVCVC stems, the V of the first syllable is elided, thus producing CanCVC, CinCVC, or CumCVC; (3) A nasal is inserted

after the first V of a CVCVC stem thus producing CVNCVC. This last process is similar to Dempwolff's assumption.

Kern²⁰ assumed that infixes like -um- and -in- and others of similar shape, like -an-, are to be traced to -m- and -n-, the first active and the second passive, or, what amounts to the same thing, nomina, for the nominal form is also the passive of the verb. This assumption regarding -m- and -n- does not seem to harmonize with what he says at the end of this paragraph, if I understand him correctly. I quote the pertinent passages from Kern: "Zij [alle deze infixen] zijn allen terug te brengen tot -m- en -n-" (p. 290); "nibung, Filippijnische talen anibung - een palmsoort, het gw. is diwung blijkens Soend, handiwung...; de nasaleering n is uit prenasaleering (nd) onstaan" (p. 341). For -an- he cited Ilk., as a language where it forms verbals, e. g. p-an-aglakog 'manner of dealing, trading,' which forms were formerly passive. In olden times m and n were preceded by different V's and infixated to the roots, like -am-, -im-, -em-, -en- and -un-. On the strength of Sund. handiwung, Dayak handiwong, Lampong hanibung, Bugi anriwu (archaic) to be read anriwung, he derived (nasalization) n from prenasalized nd. (Tag., Ilk., SamLey. anibong, Tao. anibung 'Oncosperma,')

Several facts led Dahl²¹ to consider prenasalization as a simple C and not as a complex of C's. To him there was no phonematic difference between 'buccal' and 'prenasalized' C's in medial position in the proto-language. If there was a difference at all, it must have been fixed much later, and the evolution of the two types of phonemes has been different, as in Mlg. And in a number of languages,

the evolution of prenasalization has been different from that of a complex of C's; prenasalization remains where the complex of C's has been simplified.

In Mlg. Dahl made measurements of the duration of C's, and he has established that the duration of a prenasalized C does not exceed that of a simple buccal C. He has further established that if a buccal C is voiced, the nasal is longer than the buccal. If, on the other hand, the buccal is mute, the nasal is much shorter than the buccal. For instance, in modern Betsileo the phonematic difference between the prenasalized C's and the buccal C's is in the process of obliteration. Often are confused, for example, manantona 'suspend; interrupt' and manatona 'approach; draw near.' All these phonetic phenomena of common IN as well as of Mlg. are easier to explain if prenasalized C's are considered as simple phonemes and not as a complex of phonemes. Dahl's observation in Mlg. seems to hold true also in Mnj.

A reduction of a complex of phonemes - similar to that established by Dahl in Mlg. and Mnj. - has been observed by Brandstetter.²² In several IN languages certain sounds are not articulated 'normal, full,' but 'weak and reduced.' In Gayo the media is articulated so reduced in the clusters ngg, nj, ngd, and mb that in many cases it is difficult to make out whether these are present or not (citing Hazeu). Reduced articulation also occurs in Indo-Germanic, as n before s in Latin mensa, Romance languages mesa. In Nias the nasal is sometimes dropped, e. g. lita, PAN *lintag 'leech'; in Rotti it is the plosive, e. g. tana, PAN *ta(n)Dah 'mark; sign.'

To Kaehler²³ the reduction of the nasal cluster to a simple C may be due to other factors. In some IN languages a duplicated tenuis or media may come into existence as a result of the assimilation of the nasal in a nasal plus plosive cluster, and this, by reduction becomes a simple tenuis or media. This is very common in ToB. (Examples in Dempwolff I IA [Induktiver Aufbau] and III AW, in the Appendix 6, 11, 13, 20, 22, 23, etc., and in Brandstetter, 1915, p. 55, s. 197, 1). Similarly in Sikka (Flores) where PAN *pandan 'pandanus palm' > paddang, mude (< *mudde) < Endeh munde 'grape-fruit.' Sometimes it is the plosive which is assimilated to the following nasal, e. g. Letti linna < lidna 'to accompany,' lonna < lodna 'rattan.'²⁴ A further step in the reduction is when, after assimilation, a duplicated or geminate nasal becomes a simple nasal, e. g. Endeh munde 'grape-fruit' > Rotti mune (< munne). ~~but probably not in all cases~~

Elaborating on the structures in his theory (2), Costenoble²⁴ says that in Cha. there are a small number of non-productive combinations which contain the infixes -an-, -in-, and -um- in which the V of the wordbase following the nasal of the infix is elided so that a nasal combination results. In all such cases the sound sequence remains unchanged; these cases can, therefore, be considered of later development. For example, *tuzuh (using Dempwolff's, not Costenoble's starred forms), t-an-učoq > tančoq 'show; point out with the finger,' *pusuh, f-in-usug > fensog 'edible pith of pandanus,' *sinaR, s-um-inag > sominag 'sunshine.' There are doublets which can be considered as results of analogy since for these the proto-forms are not verifiable, e. g. candaq 'shake off;

parry; divert' beside cudaq 'pour; throw away,' tengwang 'food that one takes with him' beside tigwang 'travelling companion,' omlad 'find place (in something beside ulad) 'id.' and hulad 'be able to overcome or overpower.' Costenoble cited examples in Schicht I which he ascribes to the proto-language, e. g. čapun 'bring pell-mell,' *ca(m)pul 'mix,' cābaq 'interrupt; break the talk,' *za(m)bat 'hold fast; grasp,' tēto (< tōto) 'continuous; constant,' *te(n)tuh 'sure.' In Schicht II he cited sampag 'slap,' *sampal 'slap' (Dempwolff's *[t]ampar 'strike with the hand'), tandan 'young rooster,' *tandaN 'young rooster,' tangkad 'cage,' *taNkal 'cage.'

The Meaning of Nasal Clusters

Reiterating Dempwolff,²⁵ the nasal clusters, whether obligatory or optional, have become non-productive, and their grammatical function is not explainable.

Kern²⁶ was of the opinion that the pronunciation of the non-nasal -C- distinct from that of the nasal cluster must be old, and the meanings of the forms in which they occurred must have been differentiated only in the course of time, implying that the forms were originally homosemantic. Kern's examples are Mal. rukup, rungkup 'set inclined against each other,' Sund. luse, lungse 'tired out; worn out' Old Javanese suduk, sunduk 'pierce; stab.'

Brandstetter²⁷ distinguished between Mal. tubuh 'body' (Leib), substantive, and tumbuh 'grow' (wachsen), verb, and Dayak uyah 'salt' and munyah, active verb, with m- perhaps a morphological element (which it is).

Without going to specifics, Milner²⁸ was of the opinion that the widespread

feature of homorganic nasalization by accretion (or nasalization) in IN languages has a morphophonemic or, to use a more traditional term, grammatical function.

Summary and Conclusion

A majority of linguists, like Brandstetter, Chrétien, Dempwolff, Dyen, Grace, Kachler, Kern, and Milner, either implicitly or explicitly, recognized the existence of nasal clusters in PAN. Capell doubted this while to Dahl there is no phonematic difference between the non-nasal C and the nasal cluster. Costenoble considered the nasal clusters as a later development.

Now, it is not a simple matter to go against the opinion of the majority, particularly when among that majority counts a personality with the stature of one's former mentor, i. e. Dempwolff. But there may be compelling reasons to entertain the contrary view. Although the conclusion drawn here must be taken as highly tentative, I doubt as Capell did the existence of the nasal clusters in PAN, which is tantamount to agreeing with Costenoble that they are a later development. My brief comments are given below. Also, I believe that Milner was on the right tract when he suggested that "further progress in Austronesian comparative studies is more likely to be accomplished if a resolute attempt is made to reduce rather than to increase the number of reconstructed proto-phonemes," and (it may be added) this will also result in the reduction of superfluous morphs, like proto-doubllets, proto-pseudo-doubllets or even proto-triplets, and thus simplify "the already extremely unwieldy structure of PAN."²⁹ In fairness to Dempwolff, however, I suppose it is time that the fact be made public that he used to tell his

students in the presence of the late Professor Walter Aichele that his reconstructions are not immutable, that he was encouraged to proceed with his work on the VLAW because his previous publications (which he meant as trial balloons, perhaps?) have not been adversely criticized,³⁰ and that he was leaving it to others to propound revisions later. (Unluckily, Dempwolff is no longer around to confront the revisionists.) That was, of course, before comparative AN [Austronesian] linguistics has claimed the attention of comparatists as it has after the Pacific War.

Dempwolff postulated the starred infixes $*\text{-aR-}$, $*\text{-al-}$, and $*\text{-ar-}$. My theory is that these two-phoneme infixes, together with $*\text{-VN-}$, were introduced in AN at some time in its history -- not necessarily in its proto-stage-- and that each had a distinct meaning. Dempwolff's main pre-occupation was phonological, not morphological. I have shown elsewhere³¹ that in the daughter IN languages, $*\text{-aR-}$, $*\text{-al-}$, and $*\text{-ar-}$ are reflected, to be sure, as two-phoneme infixes, but there are cases also of the occurrence of single C-phoneme infixes (Dempwolff's "erstarrte" infixes) which are vestiges of the two-phoneme infixes after loss of the V. The analogy is not far-fetched that $*\text{-VN-}$ has undergone similar reduction with N, because of its phonetic peculiarity, becoming homorganic.

Against this theory stands Dahl's findings on the nasal cluster. If prenasalization is a simple C and not a complex of C's couldn't the oral C vis-a-vis the nasal cluster be interpreted as a type of the splitting of an antecedent unit phoneme?

At this stage the nasal clusters and their meaning (or meaning-differentiating role) remain a fascinating problem awaiting definitive solution.
